**The Company**

• Cavortex Technologies International, Inc.
  ➢ Founded in 2014
  ➢ Headquartered in Irvine, California
  ➢ An American-owned, Small Business
  ➢ All products are proudly designed and manufactured in the USA

• Intellectual Property
  ➢ Invented the Cavortex reactor for multiple water uses
  ➢ International patent pending

---

**Overview of Hydrodynamic Cavitation**

Cavitation involves the formation and collapse of vapor cavities in a liquid. The collapse or implosion of these cavities creates localized zones of high temperature and pressure. Hydrodynamic cavitation occurs when liquid flow conditions create pressure variations. In aqueous streams, hydrodynamic cavitation results in formation of hydroxyl radicals, as well as transformations to dissolved salts and suspended minerals.

**The Cavortex Reaction Process**

Water is pumped into the Cavortex reactor at high pressure. Multiple units can be used in parallel to meet flow rate requirements.

In the Reactor, the process stream undergoes hydrodynamic cavitation, changing structural and charge characteristics of organic and inorganic species. Pathogens are destroyed.

The water stream can be used in tandem with separation and mitigation processes such as filtration or reverse osmosis.

Optimizing Heavy Metal and Other Contaminants Removal from Mining and Waste Water Operations

Cavortex Trials at Carpenter Snow Creek

Site Description
- Carpenter Snow Creek Mining District Superfund Site (CSCMD), Cascade County, Montana (one of hundreds of EPA designated Superfund sites)
- 9,000 acres with mine tailings, waste rock, and acid mine drainage
- 90 abandoned mines resulting in metal concentrations in surface water and soil at levels that are detrimental to human health and environment
- Added to Superfund Program’s National Priorities List in 2001

Cavortex Trials
- Cavortex trials conducted in Sep-2015. Objectives:
  - Reduce heavy metal concentrations
  - Demonstrate cost effectiveness
  - Demonstrate small footprint, rapid deployment, and low-maintenance operation
  - Mine adit water was processed with the Cavortex system under several scenarios

Removal of Primary Contaminants of Concern

Process Advantages
- Simple, robust process
  - Durable, wear-resistant components
  - No moving parts
  - Off-the-shelf auxiliaries: Pumps, valves, etc.
- Small footprint
  - Each 14" x 14" x 48" reactor processes 400 k gallons of water per day
  - Multiple units can be manifolded together: Economies of scale
- Economic Advantages
  - Low life cycle cost - No reagents or consumables
  - Extend life cycle for RO filters by minimum of 67% resulting in cost savings
  - Recovered brackish water generates additional revenue
  - Phosphates/Phosphorous generates fertilizer revenue
  - Separation of Precious Metals – generates revenue
  - Reduced waste (water, sludge, etc.) reduces other services resulting in cost savings

Other Applications for the Cavortex Technology
- Recovery of reverse osmosis concentrate: 2017 municipal desalter tests: Significant impact on brackish water
- Portable potable water systems: Emergency and backup use
- Humanitarian: Water treatment in developing countries
- Fracking water
- Coal ash pond treatment
- Irrigation and agricultural water

Results of Cavortex Trials at Carpenter Snow Creek

Results of 2017 Municipal Desalter Tests
- Facility: Calif. desalter processing 7 MG per day of brackish well water into drinking water
- Pilot test program conducted involving processing a stream of reverse osmosis concentrate through the Cavortex system and then back through RO membranes
- Goal is to recover 50% of RO concentrate without fouling membranes
Optimizing Heavy Metal and Other Contaminants Removal from Mining and Waste Water Operations

Strategic Partnerships

• Technology can be integrated with existing treatment processes for operational and financial savings
• Cavortex strategically aligns with certified service delivery partners providing "one-stop" for implementation, support, and complementary technology integration as required
• Cavortex Strategic Partners include:
  • Seasoned EPC Contractors, Geological Engineers
  • Third Party EPA-qualified Testing Labs
  • Schneider Electric
  • Mve. Suppliers US made products, Pumps, Plumbing, Valves ETC.
  • R&D, complex design, 100+ years combined experience in advanced water treatment design

Technology Status and Next Steps

• Proof-of-concept and piloting complete for initial capability
• Full-scale demonstration projects
  ➢ Mine waste – EPA select three challenge sites
  ➢ Municipal water – Approach city planners for East Coast beta site ( Loudoun/Fairfax Co, VA)
  ➢ Emergency water supplies – Approach DHS/FEMA, NGB, USAID
• Commercialization

Conclusions

• The Cavortex process employs hydrodynamic cavitation to transform process water stream characteristics
• The process is robust, low-maintenance, and has a small footprint
• Carpenter Snow Creek trials showed high levels of metals removal
• Next steps are full-scale demonstration and commercial deployment

Cavortex can provide solutions to reduce the time it takes to clean up existing Superfund Projects making it possible to transfer projects earlier to the States that have responsibility for the affected areas.
