

**Incremental Sampling Methods & Best Practices for Lead Investigations**

Cathy Amoroso  
U.S. EPA, Region 4  
Superfund Division

EPA United States Environmental Protection Agency FRTR November 8, 2017

### Former Chattanooga Foundries

- ◆ 60+ foundries historically located in Chattanooga.
- ◆ Generated spent sand and baghouse dust over many decades.

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 2

### Former Chattanooga Foundries

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 3

### Spent Foundry Sand

- ◆ Foundry waste material can contain lead
- ◆ Foundry material was used as fill

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 4

### Initial EPA Involvement

- 2011: resident presented at ER with Pb poisoning
- 2012: EPA removed Pb contaminated soil at 84 residences
- Limited geographic area
- Extent of contamination undefined
- **Other residential areas may be similarly impacted**
- **Risk undefined**

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 5

### Potential Large Urban Lead Site: Where to Begin?

Is all of downtown Chattanooga contaminated?

NO

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 6

### Objectives of the Investigation

- ◆ Establish urban background levels
- ◆ Collect high quality data to support risk management decisions
- ◆ Produce data that can be used for multiple purposes:
  - Site characterization
  - Time-critical removal decisions
  - Future RI & Risk Assessment

Protect on
Federal Remediation Technology Roundtable November 8, 2017 7

### Best Practices for Sampling for Lead in Soil

- Establish robust background concentration/range
- Incremental Sampling Method (ISM)
- OLEM Directive for sieving soil at lead sites
- EPA Superfund XRF Field Operating Guide
- Lead bioavailability testing
- Develop site-specific cleanup level for lead

United States Environmental Protection Agency
Federal Remediation Technology Roundtable November 8, 2017 8

### Best Practice: Establish Background Level for Lead

Chattanooga Urban Bkg Study

- ◆ 5x5 mile grid; 50 randomly selected cells
- ◆ Used SAP/QAPP template from larger R4 urban background study
- ◆ 7 metals associated with foundries: Pb, As, Cd, Cr, Cu, Ni, Zn

EPA United States Environmental Protection Agency
Federal Remediation Technology Roundtable November 8, 2017 9

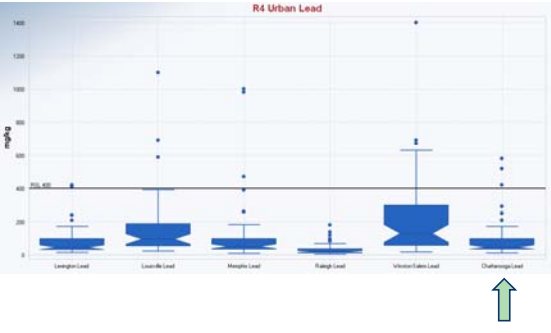

### Urban Background Results

	RSL	Mean Bkg (SI)	Urban background 95% UTL
Lead	400	60	175
Arsenic	0.68	3.4	7
Chromium		25	33

- Background lead consistent with other Southeastern cities
- Robust background dataset ready for RI
- Elevated lead is not "everywhere"

EPA United States Environmental Protection Agency
Federal Remediation Technology Roundtable November 8, 2017 10

### Chattanooga Lead Background vs. 5 Cities

EPA United States Environmental Protection Agency
Federal Remediation Technology Roundtable November 8, 2017 11

### Identify Study Areas

EPA United States Environmental Protection Agency
Federal Remediation Technology Roundtable November 8, 2017 12

### Field Operation

United States Environmental Protection Agency
Federal Remediation Technology Roundtable
November 8, 2017
13

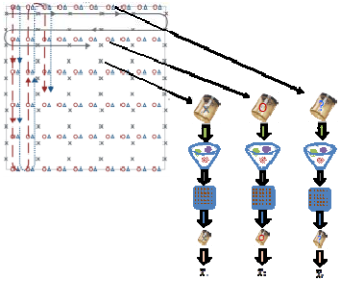

### Best Practice: Incremental Sampling Methodology (ISM)

**Why ISM?**  
Superior method to derive an unbiased estimate of the mean concentration of a given area (i.e. decision unit)

One ISM sample is collected for each decision unit

Each sample is comprised of 30 aliquots, and produces one concentration that represents the entire decision unit (yard)

Statistically defensible data on which to base decisions

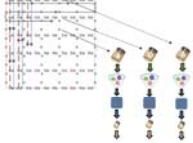

United States Environmental Protection Agency

### Incremental Sampling in Chattanooga

United States Environmental Protection Agency
Federal Remediation Technology Roundtable
November 8, 2017
18

### Collecting ISM: Time & Effort

*One 30-point composite from a residential yard takes 8 minutes to collect*

### ISM Includes Representative Subsampling

*Guidance for Obtaining Representative Laboratory Analytical Subsamples from Particulate Laboratory Samples EPA/600/R-03/027, November 2003*

### Disaggregation and Drying

### OLEM Lead Sieving Directive

*Recommendations for Sieving Soil and Dust Samples at Lead Sites for Assessment of Incidental Ingestion, OLEM Directive 9200.1-128*

### OLEM Lead Sieving Directive

- Recommends < 150 μm particle size (#100 mesh)
- Incidental ingestion greater for fine particles.
- Dermal adherence greater for fine particles.
- Increased contaminant concentration, mobility, and bioavailability in fine particles.

### Dermal Adherence

The left image shows a blue nitrile glove, and the right image shows a close-up of a hand with soil particles adhering to the skin, demonstrating dermal adherence.

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 25

The top photo shows a child playing in a sandbox, and the bottom photo shows a child with soil on their hands, illustrating potential lead exposure pathways.

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 26

### Sieve of Stacked Mesh (#10 and #100)

The image shows a sieve of stacked mesh, used for soil sampling, with the #10 and #100 sieves visible.

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 27

The image shows a person wearing blue gloves, handling a sieve of stacked mesh, demonstrating the use of the sieve in soil sampling.

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 28

### Fine Fraction <150 microns

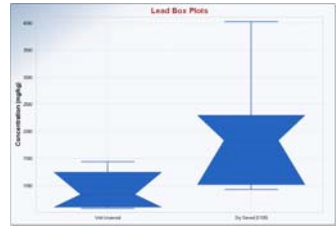

The image shows a tray containing a dark, fine fraction of soil, representing the material that passes through the #100 sieve.

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 29

### Lead Concentrates in the Fine Fraction

Pb in mg/kg	
Unsieved	Sieved
603	1016
837	1832
1434	4021
1245	2300
591	936

The box plot shows that the sieved soil has a higher median lead concentration (approximately 2300 mg/kg) compared to the unsieved soil (approximately 1245 mg/kg). The y-axis represents Concentration (mg/kg) from 0 to 4000.

At this site, sieved soil has approximately 100 ppm higher concentration than in unsieved.

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 30

### ISM Includes Representative Subsampling

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 31

### Representative subsamples for analysis

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 32

### Best Practice: X-Ray Fluorescence Field Operations Guide

*Superfund X-Ray Fluorescence Field Operations Guide, EPA Region 4, July 19, 2017 (SFDGUID-001-R0)*

- ◆ Tool for OSCs and RPMs
- ◆ Methodology to collect high quality XRF data for lead and arsenic
- ◆ Provides real-time data
- ◆ Multiple readings and QA/QC measures
- ◆ Produces "definitive" data = data of sufficient quality to use in remedial and removal decisions and in the BLRA

EPA Protection Federal Remediation Technology Roundtable November 8, 2017 34

### XRF vs Lab Data: Lead

**R Squared = 0.98**  
Excellent agreement between XRF data and lab data.

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 35

### XRF vs. Lab: Pb

XRF provides reliable, reproducible & defensible data for Pb for this project (n = 300+)

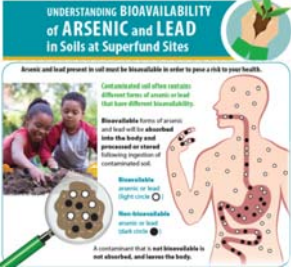

EPA United States Environmental Protection Agency Federal Remediation Technology Roundtable November 8, 2017 36

### Best Practice: Site-specific Clean-up Levels for Lead

 United States Environmental Protection Agency  
 Federal Remediation Technology Roundtable    November 8, 2017    37

### Best Practice: Lead Bioavailability

**Bioavailability**

- A measure of the amount of lead absorbed into bloodstream
- Important input in clean up level

 United States Environmental Protection Agency  
 Federal Remediation Technology Roundtable    November 8, 2017    38

### Integrated Exposure Uptake Biokinetic (IEUBK) Model

**Predicts blood lead levels in children resulting from environmental exposures.**

**Utilized by EPA to set cleanup goals for lead in soil.**

**Children Are Often More Vulnerable to Site Chemicals**

They can swallow dirt when they play 	The same "dose" of a chemical has a greater effect on a smaller person due to lower body weight 
---	--

 United States Environmental Protection Agency  
 Federal Remediation Technology Roundtable    November 8, 2017    39

### Best Practice: Site-specific Clean-up Levels for Lead

- ◆ Use site-specific lead bioavailability in the IEUBK model
- ◆ ↑BA will ↓health-based clean-up level
- ◆ IEUBK default BA = 30%
- ◆ In this case, 33 soil samples were analyzed for lead bioavailability
- ◆ Chattanooga site soils BA = 29-50%; mean = 36%
- ◆ Other inputs to IEUBK being updated, esp. target blood lead level

 Federal Remediation Technology Roundtable    November 8, 2017    40

### SOP for *In Vitro* Lead and Arsenic Testing

 United States Environmental Protection Agency  
 Federal Remediation Technology Roundtable    November 8, 2017    41

### Conclusion of Chattanooga Soil Study

- ✓ Elevated lead is not "everywhere; can distinguish between suspect material and urban background
- ✓ Data supports risk management decisions
- ✓ Unacceptable risk at some properties
- ✓ Removal warranted at some properties
- ✓ Remedial action planned
- ✓ Site-specific cleanup level can be developed

 Federal Remediation Technology Roundtable    November 8, 2017    42

### Best Practices for Sampling for Lead in Soil

- Establish robust background concentration/range
- Incremental Sampling Method (ISM)
- Sieve soil; analyze fine fraction
- Consider XRF analysis
- Determine site-specific lead bioavailability
- Develop site-specific cleanup level for lead

Q & A
