

**THE HANFORD SITE**

**Using Remedy Implementation Information to Guide Remedy Optimization**

Federal Remediation Technology Roundtable Meeting

Kate Amrhein, U.S. Department of Energy  
 Emerald Laja, U.S. Environmental Protection Agency  
 Michael Truex, Pacific Northwest National Laboratory

November 13, 2019

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

**THE HANFORD SITE | Outline**

- Hanford Case Study Site Description
- Conceptual Site Model (CSM) Elements of Remedy Selection
- CSM Refinement: Input from Remedy Implementation and Performance Assessment
- Identified Remedy Optimization Targets
- Optimization Study Approach and Adaptive Site Management

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

**THE HANFORD SITE | Hanford Site Groundwater Units**

The map displays the Hanford Site area with various groundwater units color-coded. A legend in the bottom left corner provides details for each unit, including names like 'Hanford Aquifer', 'Ringold Aquifer', and 'Ringold Lower Mud', along with their characteristics such as 'Dense Nonaqueous Phase Liquid (DNAPL)' and 'No DNAPL'.

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

**THE HANFORD SITE | Historical Hanford Processes**

The diagram illustrates the historical processes at the Hanford Site. It shows a cycle starting with 'Chemical Separations', leading to 'Irradiate Fuel Elements', then 'Manufacture Fuel Elements', and finally 'Plutonium Finishing'. A central map of the Hanford Site shows the locations of these processes. A legend at the bottom identifies symbols for 'U.S. Fuel & Waste Service Management Land', 'Department of Energy Management Land', 'Department of Energy Department of Fish & Wildlife Management Land', and 'Historic Groundwater Boundary'.

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

**THE HANFORD SITE | 200-ZP-1 OU Conceptual Site Model**

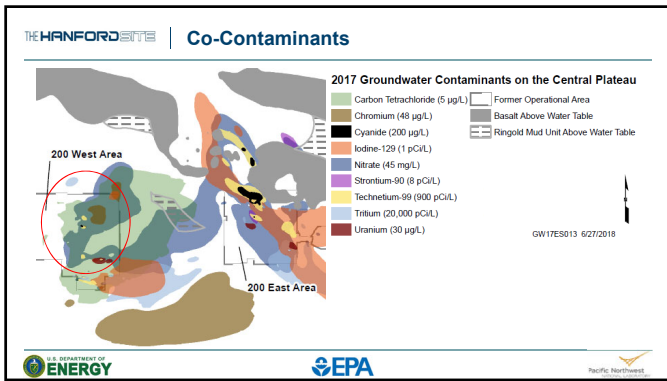

- Carbon tetrachloride (CCl<sub>4</sub>) disposed of in three nearby locations
- Large groundwater mound spread CCl<sub>4</sub> in the groundwater (10-square-kilometer plume, over 50 meters thick)
- Early action of Soil Vapor Extraction (SVE) removed 80,000 kilograms; no continuing source
- No dense nonaqueous phase liquid (DNAPL) below water table
- Groundwater mound has dissipated; groundwater flow rate is slow
- Groundwater concentrations 1,000 times the remedial action objective (RAO); natural attenuation occurs, but plume is too concentrated and large for passive-only remedy
- Radionuclide and inorganic co-contaminants are present

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

**THE HANFORD SITE | 200-ZP-1 OU Conceptual Site Model (cont.)**

The diagram shows a cross-section of the groundwater system. The top layer is labeled 'Hanford' and is 'Addressed by SVE'. Below it is the 'Ringold E' aquifer, which contains a 'Historic groundwater mound: Broad plume spread multiple directions'. The bottom layer is 'Ringold Lower Mud' and 'Ringold A'. A 'Window to lower part of aquifer' is shown between Ringold E and Ringold A. The diagram indicates 'No DNAPL' in the Ringold E aquifer. Vertical scale markers show 'Approx. 75 m' and 'Approx. 50+ m'.

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

### Conceptual Site Model – Remedy Selection

- RAO to restore aquifer
- Source addressed by SVE and no DNAPL present
- Large plume with co-contaminants difficult for in situ remediation
- Pump-and-treat (P&T) systems can effectively diminish plumes; difficulty in reaching RAO
- If plume is diminished, natural attenuation can reach RAO

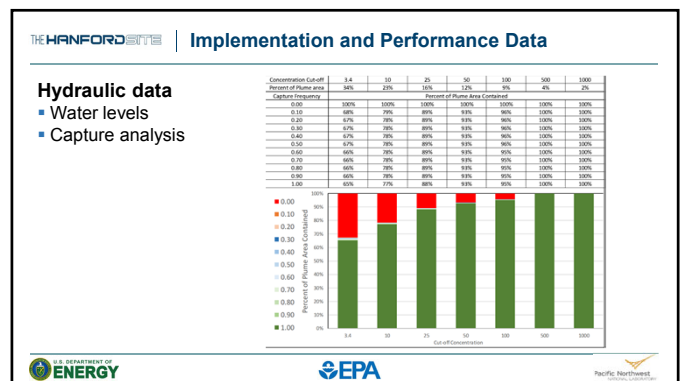

### Conceptual Site Model – Remedy Selection (cont.)

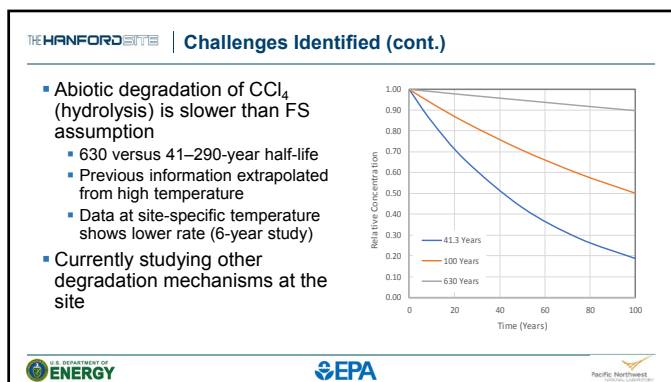

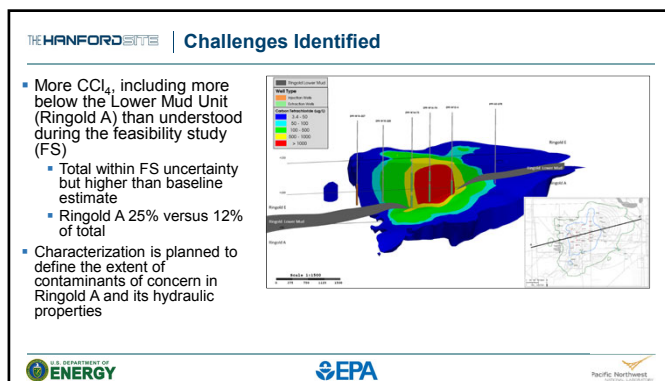

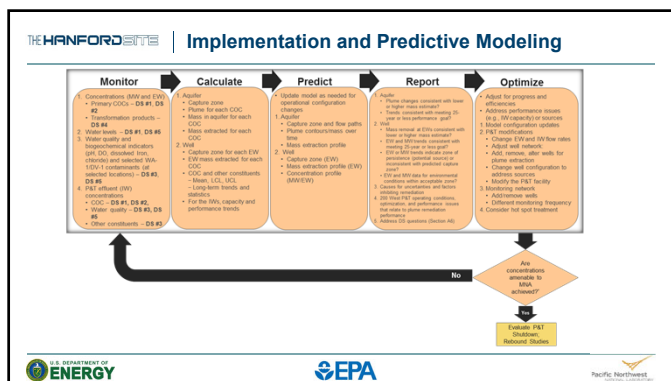

- Remedy applies P&T with transition to Monitored Natural Attenuation (MNA)
- Anticipated 25 years of P&T and 100 years of MNA to meet RAO based on Feasibility Study CSM
  - CCl<sub>4</sub> distribution – uncertainty in mass (collect data during remedy)
  - Attenuation rate – uncertainty est. 41–290-year half-life (implement study)

### 200 West P&T Well Network

#### 200 West P&T Well Network

- Began operations in 2012
- 33 Extraction Wells located within carbon tetrachloride plume
- 35 Injection Wells on the outer edges of the highest concentration area

- ### Evaluation of CCl<sub>4</sub> Information
- Need more intensive mass removal during the P&T period to enable transition to MNA
  - May need more MNA time
  - Need more information in the Ringold A to assess the best approach

- ### Nitrate Considerations
- Sufficient nitrate may have been removed from Ringold E to stop active biological treatment and start transition to MNA as identified in the record of decision (ROD)
    - Blending during P&T
    - Natural attenuation after P&T
  - Suspending biological treatment would:
    - Enable more efficient approach for increasing CCl<sub>4</sub> treatment capacity
    - Eliminate operational difficulties associated with biofouling in wells

### 200 West Central Treatment Facility Current Treatment Capacity

- Approximately 40% of Operations and Maintenance cost is due to nitrate treatment
- Biofouling issues with wells would decrease significantly with removal of FBRs/MBRs.

Limits flow through the system

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

### Optimization Study Rationale

- Evaluated six years of 200 West P&T operation data
- Current remedy as designed is projected to be insufficient for meeting remedial action objectives due to
  - Larger mass of CCl<sub>4</sub> in the aquifer
  - Slower degradation rate
- Important to consider remedy optimization for CCl<sub>4</sub> because it is the most significant risk driver; unlike other contaminants, its concentration is up to 1,000 times greater than the RAO

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

### Optimization Study Plan

- Suspend biological treatment for specified amount of time and gather data on contaminant behavior in the aquifer
- Treatment capacity for CCl<sub>4</sub> will be increased with an additional air stripper and expanded well network
- Intended to be an iterative process of data evaluation and decision-making
- Once sufficient data is collected and evaluated, the site and regulators will work together to determine if the remedy needs to be changed
  - Will consider if RAOs and timeframes listed in ROD can be achieved
  - No intent to change cleanup levels

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

### EPA Support for Optimization

- September 2012: EPA released a *National Strategy to Expand Superfund Optimization Practices from Site Assessment to Site Completion*.
  - Envisions the application of optimization concepts throughout all phases of the remedial process
- Systematic site review at any phase of the cleanup process to:
  - Identify opportunities to improve remedy protectiveness, effectiveness and cost efficiency
  - Facilitate progress toward completion of site work

U.S. DEPARTMENT OF ENERGY | EPA | Pacific Northwest

### EPA Support for Use of Adaptive Management

Figure 1 Adaptive Management's Application in the Superfund Remedial Process

Adaptive management is a formal and systematic site or project management approach centered on rigorous site planning and a firm understanding of site conditions and uncertainties. This technique, rooted in the sound use of science and technology, encourages continuous re-evaluation and management prioritization of site activities to account for new information and changing site conditions. A structured and continuous planning, implementation and assessment process allows EPA, states, other federal agencies, or responsible parties to target management and resource decisions with the goal of incrementally reducing site uncertainties while supporting continued site progress.

EPA Memo, Broaden the Use of Adaptive Management, July 2018
